

PORTALPROOF

Verifiable creative commissions on Portaldot V3

Agreement, delivery, and payment evidence in one creator workflow

Ecosystem DApps
Week 2 Check-in

nato-san
October 2026

Creative commissions lack a shared record

Social messages can start the work, but they do not create durable evidence.

The brief changes across messages

Creators and clients often rely on separate conversations to remember the agreed scope and deadline.

Delivery and payment are hard to verify

A file link or payment screenshot cannot reliably prove what happened later.

A real deliverable needs a verifiable work history

One workflow from request to certificate

PortalProof connects familiar web forms with Portaldot V3 evidence.

1

Request

The client submits the brief and wallet address.

2

Agreement

The creator records a terms hash as an order proof.

3

Delivery

PortalProof records a hash of the delivery URL.

4

Payment

The app checks sender, recipient, amount, and success.

5

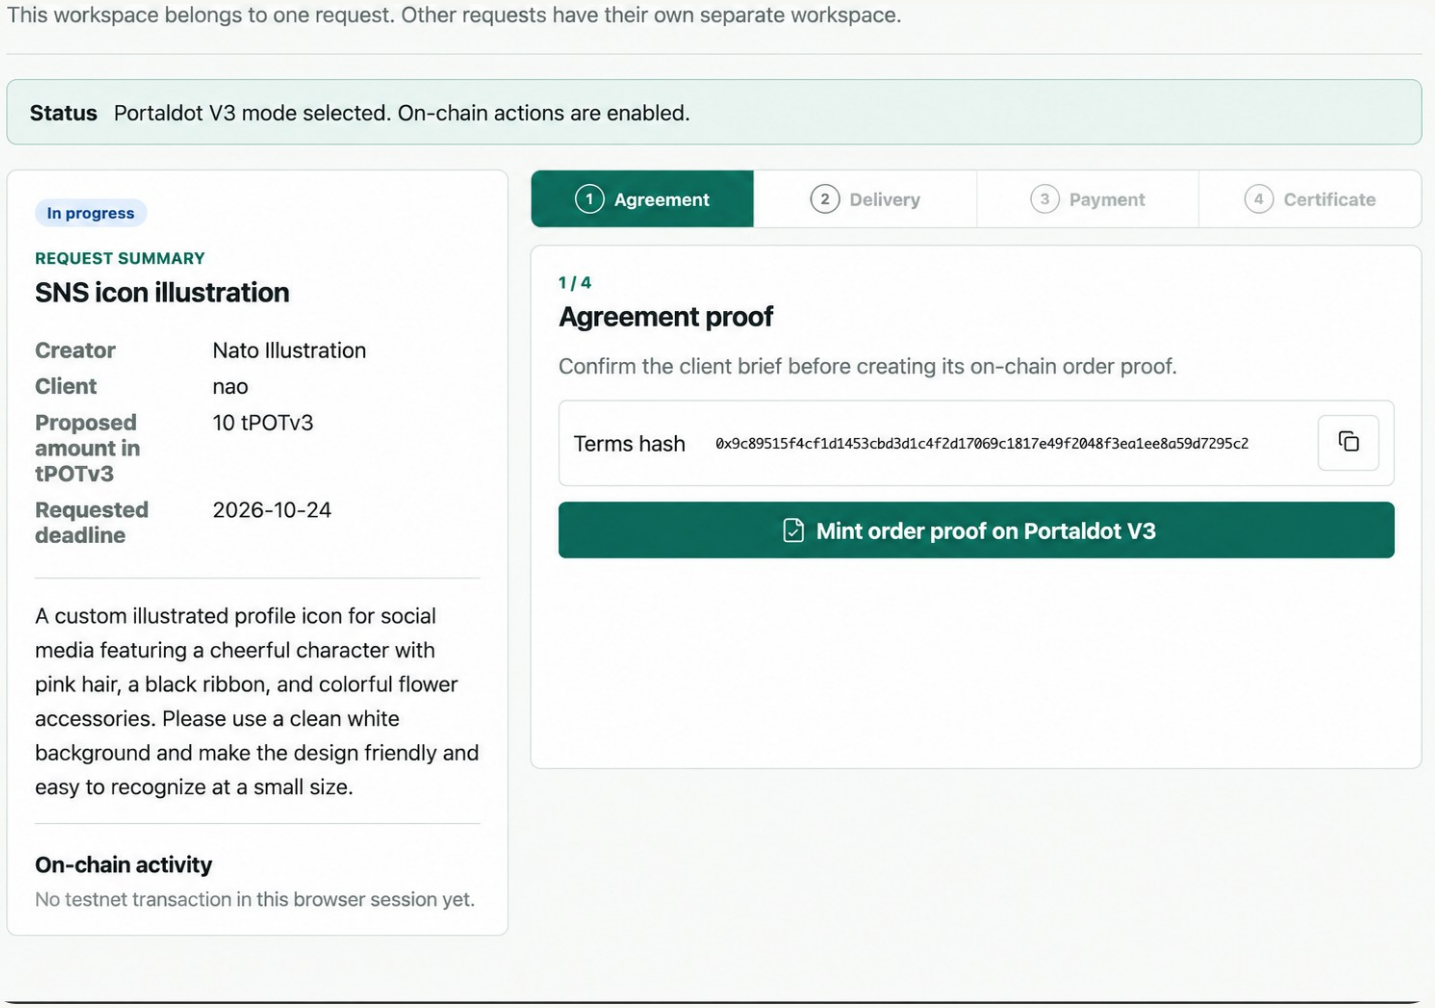

Certificate

The final view summarizes the verified records.

The files stay off-chain. PortalProof records compact hashes and transaction evidence.

The current MVP runs on the public web

English and Japanese interfaces support local demonstration and real testnet use.

Implemented

Request links

Creators publish a reusable commission page.

Request inbox

Each client request has its own workspace.

On-chain proof

Agreement and delivery hashes reach Portaldot V3.

Payment check

Only matching native payments can be recorded.

Certificate

The final screen presents the evidence clearly.

Portaldot gives each work step objective evidence

The shared Solidity contract runs on the Portaldot V3 EVM testnet.

Why it matters

A transaction hash gives both parties a common reference. The proof survives outside the original chat, browser session, or social platform.

Contract 0xBaE8933886e1520e5FCa3eDed119c08b29022D79

A complete commission flow passed on testnet

The MVP executed real order, delivery, and native payment transactions.

01 **Contract deployed**

0x29b2…3565

02 **OrderCreated**

0x2bcc…6815

03 **DeliverySubmitted**

0x9f8e…76db9

04 **PaymentRecorded**

0x6327…3a0

Payment verification

- Sender matches the client
- Recipient matches the creator
- Amount meets the agreement
- Receipt status is successful

Result: certificate generated from real on-chain evidence

The next release focuses on safer payment and simpler work

The current proof layer is stable enough to support the next product milestones.

Now

Working proof workflow

Public DApp, shared contract, complete testnet transaction flow, documentation, and demo.

Next

Escrow deposits

Clients deposit funds after agreement. Creator payment releases after delivery approval.

Later

Creator operations

Protected delivery links, revision handling, income management, and completed-job archives.

PortalProof can become the trust and operations layer for independent creative work.
